1 Explanatory Notes

1.1 Release Notes v7

Demscore provides worldwide free access to harmonized data on Democracy, Environment, Migration, Social Policy, Conflict and Representation from several of the world's most prominent social science research institutes. The interdisciplinary nature of Demscore data facilitates large-scale comparative analyses. This is essential to advance adequate policy responses to complex societal challenges associated with the Sustainable Development Goals (SDGs) and beyond, facing Sweden, Europe, and the world today.

With a firm commitment to transparency and openness, Demscore v7 enables users to gain comprehensive insights into various topics across the social sciences. The joint infrastructure ensures data integrity and quality at the highest international standards and maximizes usability in the measurement of contextual data with 25.000 variables across nearly all countries in the world, from 1750 to the present.

This creates critical time- and cost saving advantages in data collection, management, distribution, and not the least for end-users in the scientific community. Demscore's unique approach to translating and merging data scales up to more than 410.000 variable versions available in the infrastructure, storing more than 10 billion non-missing observations.

This collaborative effort between leading Swedish universities pushes the scale of social science data to a new level and offers unprecedented possibilities for interdisciplinary research and knowledge advancement.

These are the key features of Demscore:

1. **Customized Download:** A fully normalized, joint PostgreSQL database, sophisticated programming, and a user-friendly web-based interface for users to generate custom-designed datasets and codebooks for download.
2. **Translations and Data Merges:** Demscore currently offers more than 1100 merge options between datasets.
3. **Metadata:** Demscore takes information on and organization of metadata to new heights with the inclusion of customized codebooks, a detailed methodology document, and a comprehensive handbook.
4. **Handling of Missing Data:** Demscore pioneers in developing an innovative approach to tackle missing data. Researchers can now account for missing values with increased precision, leading to more robust and reliable analyses.
5. **Merge Scores:** Demscore introduces a unique merge mechanism. This powerful tool enables researchers to combine datasets effortlessly, uncovering connections and patterns that were previously hidden in isolated data silos.
6. **Thematic Datasets:** Demscore provides researchers with curated thematic datasets, each focused on a specific topic. These datasets bring together relevant variables from across the Demscore partners, facilitating in-depth investigations and comprehensive analyses of specific domains.
7. **Interactive Web Portal:** In addition to all the above, Demscore's web portal offers interactive visualization tools, user support and additional information on all partners and data sources.

1.2 New in Demscore version 7

A detailed description of changes and additions made for version 7 compared to version 6 can be found in the Methodology Document.

1.3 The Demscore Codebook

The autogenerated Demscore Codebook lists variable entries for those variables chosen by the user along with citation guidelines and licenses per variable.

The meta data is extracted from the codebooks per dataset stored in a table in the Demscore PostgreSQL database with one row per variable for all datasets. This table includes codebook entries, variable tags, labels, and other variable information in LaTeX format used to generate an automated codebook.

Demscore maintains a single set of standard entries for metadata across all datasets, to which all project members contribute their information. Additionally, variables within different datasets may have varying sets of additional information requirements specific to each dataset. These dataset-specific entries are also included, but they are presented as variable-specific metadata beneath the standard entries.

At the outset of the harmonization process, Demscore underwent a thorough variable name cleanup. This involved tasks such as replacing spaces or dots in variable names with underscores and converting all letters to lowercase. Notably, the original tags remain preserved and stored in the PostgreSQL table. Each variable in Demscore is accessible in both short and long forms. The short form comprises the cleaned version of the original variable tag, while the long form starts with the dataset name from which it originates, followed by the cleaned variable name.

For instance, the original name of the variable *MinisterPersonalID* from the H-DATA Foreign Minister Dataset is included as *ministerpersonalid* (short form) and *hdata_fomin_ministerpersonalid* (long form) in Demscore.

In addition, each dataset includes Demscore unit-identifier variables which are named according to the following naming scheme: Beginning with *u_*, followed by the name of the primary unit and finally the variable tag. The *year-* variable from the COMPLAB SPIN The Out-of-Work Benefits Dataset (OUTWB), which is part of the primary unit *u_complab_country_year* has the Demscore unit identifier name *u_complab_country_year_year*.

1.4 Methodology

For details on our methodology please see the Demscore Methodology document available for download on the Demscore website.

1.5 Citations

The Demscore project does not have a formal citation of its own. Hence, when using Demscore, we suggest that you cite the respective projects and datasets. We indicate how every dataset is to be cited in the autogenerated codebook you retrieve with your data download, both in the dataset description and the codebook entry for each variable. Most often it is sufficient to cite the dataset a variable originates from, but sometimes there is a variable specific citation listed in the codebook entry in addition to that. For these cases, please also add the variable specific citation to the reference list of your publication. Full references are linked in the codebook entries of the variables and listed in the codebook's bibliography. We suggest you to also cite the Demscore Methodology Document when using data retrieved through Demscore.

1.6 Missing Data

Demscore indicates different types of missingness for observations in the customized datasets:

Missing in original data = Whenever an observation in the original variable is a missing (NA, missing code such as 7777, blank cell), we preserve this missing value. When the original source has special codes for various types of missing, those are preserved.

Missing code: -11111 = Demscore code for observation is missing due to the translation/merge, i.e., missing data due to no data being included for this combination of identifiers in the end Output Unit.

Missing code: -22222 = No observation is merged/translated, but the original data contains information for these identifier combinations elsewhere. For these cases, we use a different code. The

user needs to consult the reference documents (Methodology Document Section 5.1. or the Demscore Handbook) to clarify why the translation to the identifier combinations in the end Output Unit was not possible.

Please note that an observation that is missing in its original output unit does not take the value -11111, but appears as NA/blank cell in the customized dataset.

1.7 Download ID

The download ID can be shared with other users for replication purposes. A user can type the download ID into the Demscore website and retrieve the same download selection and files as the original user. This ID is autogenerated for each download from the Demscore website and will always retrieve the same data, even if the Demscore version was updated in the meantime.

1.8 Unit Identifier Variables

An Output Unit is defined as an output format in which variables can be retrieved from one or more datasets through a strictly defined output grid. A unit table defining this output grid contains unit identifier columns with `u_` prefixes and the table is sorted based on these unit identifier columns and has a fixed number of rows. Unit columns are based on the columns that constitute the unit of analysis in a dataset. They are added to the original dataset and marked by a unit prefix (consisting of a `u_` and the dataset unit name) before the original variable name. Unit columns can contain slightly modified data, e.g., missing values are replaced by a default value. Sometimes we add additional columns to the unit table, for instance if a dataset includes both a `country_id` column with a numeric country code, we add the variable storing the full country name to the unit table as well for better readability.

2 REPDEM

The **Representative Democracy Data Archive (REPDEM)** presents the comparative data collection efforts undertaken by various research and data infrastructure projects on political institutions, political parties, cabinets and governments in Europe. As a world-leading database for research on the competition for government in Europe, the archive contains unique data on governments, parliaments, political parties, length of government formation periods, bargain rounds, as well as procedures and mechanism for intra-coalition governance, etc. The latest updates were made in the research infrastructure project Party Government in Europe Database (PAGED). PAGED builds on REPDEM's previous international and comparative projects on European parliamentary democracy. More information is available on the project's website: <http://repdem.org>

2.1 REPDEM Basic

Dataset tag: repdem_basic

Output Unit: Repdem Cabinet-Date, i.e., data is collected per cabinet and date. The unit for this dataset is a cabinet and the day a cabinet started. That means each row in the dataset can be identified by a cabinet in combination with a date, using the columns cab_name and date_in. The unit can also be expressed using the columns cab_id and date_in.

Description: Party Government in Europe Database (PAGED) – Basic dataset, is a research infrastructure project that aims to build a state-of-the-art database for comparative coalition research on political institutions, political parties, parliaments and governments.

This comparative dataset builds on previous datasets (Andersson et al 2020, Bergman et al 2019, Bergman et al 2021, Bergman et al 2024, Hellström et al 2021, Strøm et al 2008), and has been updated in-house to cover additional years, additional countries (vetted by county experts), and additional variables. The dataset provides detailed information on important aspects of government formation and government termination in 33 parliamentary democracies from 1943 (or their democratic transitions) up to late-2025.

Dataset tag: repdem_basic_party

Output Unit: Repdem Cabinet-Party; data is collected per cabinet and party.

Description: The datasets collect variables containing information on political parties in Europe.

This comparative dataset builds on previous datasets (Andersson et al, 2020; Bergman et al, 2019; Bergman et al, 2021; Bergman et al, 2024; Hellström et al, 2021; Strøm et al, 2008), and has been updated in-house to cover additional years, and also includes additional countries vetted by country experts. The dataset provides detailed information on parties represented in 33 parliamentary democracies from 1945 (or their democratic transitions) until mid-2025. The parties are nested in the cabinets present in the Representative Democracy Data Archive (REPDEM) - Basic government datasets.

2.4 REPDEM Potential Governments Dataset (Basic)

Dataset tag: repdem_basic_potcoal

Output Unit: Repdem Cabinet-Potential Coalition; data is collected per cabinet and potential coalition partners.

Description: The datasets collect variables containing information on potential governments in Europe. This comparative dataset builds on previous datasets (Andersson et al 2020, Bergman et al 2019, Bergman et al 2021, Hellström et al 2021, Strøm et al 2008), and has been updated in-house to mid-2025. The dataset contains an exhaustive list of potential cabinets and coalitions for each government formation

opportunity included in the PAGED basic dataset, with variables recording various attributes of these potential cabinets and coalitions. Each government formation opportunity corresponds to a cabinet in the REPDEM basic dataset.

2.7 REPDEM PAGED Western, Central and Eastern Europe

Dataset tag: repdem_wecee

Output Unit: Repdem Cabinet-Date, i.e., data is collected per cabinet and date. That means each row in the dataset can be identified by a cabinet in combination with a date, using the columns cab_name and date_in. The unit can also be expressed using the columns cab_id and date_in.

Description: This dataset contains data on governments, parliaments, political parties, and political institutions for Western Europe until 2019 and data for Central and Eastern Europe until 2021.

It includes data collected by experts on coalition politics in their respective countries using standardised coding instructions and interview guidelines. Specifically, the data were gathered from official documents (government, administration, and parliament) and party documents (election manifestos, coalition agreements), by conducting semi-structured interviews with (former) staff and cabinet members as well as a systemic analysis of media reports.

2.8 REPDEM PAGED Western, Central and Eastern Europe (Monthly)

Dataset tag: repdem_wecee_month

Output Unit: Repdem Cabinet-Month; data is collected per cabinet and date, but the dataset includes one row for each year the cabinet was in power.

Description: The Cabinet-Month Version of the Party Government in Europe Database (PAGED) – Central Eastern and Western Europe Dataset.

The periodized datasets are mainly intended to be used for empirical models that require time-varying data on a yearly, quarterly, or monthly basis. Please note that the data sometimes contain two different governments the same year/quarter/month. This is the case when there is change of government and new government came into power the same year, quarter, or month as the old government resigned.

The Central Eastern Europe and Western Europe dataset contains data on governments, parliaments, political parties, and political institutions for Western Europe until 2019 and data for Central and Eastern Europe until 2021.

It includes data collected by experts on coalition politics in their respective countries using standardised coding instructions and interview guidelines. Specifically, the data were gathered from official documents (government, administration, and parliament) and party documents (election manifestos, coalition agreements), by conducting semi-structured interviews with (former) staff and cabinet members as well as a systemic analysis of media reports.

2.9 REPDEM PAGED Party Dataset (WE+CEE)

Dataset tag: repdem_wecee_party

Output Unit: Repdem Cabinet-Party; data is collected per cabinet and party.

Description: This dataset contains data on governments, parliaments and political parties for Western Europe until 2019 and data for Central and Eastern Europe until 2021. The unit of analysis in the Party datasets is individual political parties.

The dataset includes data collected by experts on coalition politics in their respective countries using standardised coding instructions and interview guidelines. Specifically, the data were gathered from official documents (government, administration, and parliament) and party documents (election manifestos, coalition agreements), by conducting semi-structured interviews with (former) staff and cabinet members as well as a systemic analysis of media reports.

2.10 REPDEM PAGED Potential Governments Dataset (WE+CEE)***Dataset tag:*** repdem_wecee_potcoal***Output Unit:*** Repdem Cabinet-Potential Coalition; data is collected per cabinet and potential coalition partners.***Description:*** This dataset contains data on potential coalitions (proto-coalitions) Western Europe until 2019 and data for Central and Eastern Europe until 2021.The dataset helps in modelling the choice of political parties to decide on one government alternative from a set of choice alternatives or potential governments. In the data, each row provides the full information for one choice (a potential government) nested in a government formation opportunity. The number of potential cabinets (or choices) is $2^n - 1$, where n denotes the number of parliamentary parties at a given government formation opportunity. For instance, if there are five parliamentary parties in a party system this means that there are 31 potential cabinets (i.e. rows) in a given government formation opportunity. In the dataset, there is also an indicator variable taking the value 1 for the government that formed and 0 otherwise.

2.11 REPDEM PAGED Western, Central and Eastern Europe (Quarterly)*Dataset tag:* repdem_wecee_quarter

Output Unit: Repdem Cabinet-Quarter; data is collected per cabinet and date, but the dataset includes one row for each year the cabinet was in power.

Description: The Cabinet-Quarter Version of the Party Government in Europe Database (PAGED) – Central Eastern and Western Europe Dataset.

The periodized datasets are mainly intended to be used for empirical models that require time-varying data on a yearly, quarterly, or monthly basis. Please note that the data sometimes contain two different governments the same year/quarter/month. This is the case when there is change of government and new government came into power the same year, quarter, or month as the old government resigned.

The Central Eastern Europe and Western Europe dataset contains data on governments, parliaments, political parties, and political institutions for Western Europe until 2019 and data for Central and Eastern Europe until 2021.

It includes data collected by experts on coalition politics in their respective countries using standardised coding instructions and interview guidelines. Specifically, the data were gathered from official documents (government, administration, and parliament) and party documents (election manifestos, coalition agreements), by conducting semi-structured interviews with (former) staff and cabinet members as well as a systemic analysis of media reports.

2.12 REPDEM PAGED Western, Central and Eastern Europe (Yearly)*Dataset tag:* repdem_wecee_year

Output Unit: Repdem Cabinet-Year; data is collected per cabinet and date, but the dataset includes one row for each year the cabinet was in power.

Description: The Cabinet-Year Version of the Party Government in Europe Database (PAGED) – Central Eastern and Western Europe Dataset.

The periodized datasets are mainly intended to be used for empirical models that require time-varying data on a yearly, quarterly, or monthly basis. Please note that the data sometimes contain two different governments the same year/quarter/month. This is the case when there is change of government and new government came into power the same year, quarter, or month as the old government resigned.

The Central Eastern Europe and Western Europe dataset contains data on governments, parliaments, political parties, and political institutions for Western Europe until 2019 and data for Central and Eastern Europe until 2021.

It includes data collected by experts on coalition politics in their respective countries using standardised coding instructions and interview guidelines. Specifically, the data were gathered from official documents (government, administration, and parliament) and party documents (election manifestos, coalition agreements), by conducting semi-structured interviews with (former) staff and

cabinet members as well as a systemic analysis of media reports.
